Cholera in the Americas - Situation summary

Between epidemiological week (EW) 1 and EW 43 of 2016, a total of 35,755 cholera cases were reported in four countries of the Americas: the Dominican Republic (1,097), Ecuador\(^1\) (1), Haiti (34,656), and Mexico (1). Of the total cases, 97% were reported in Haiti. Table 1 shows the number of cholera cases reported in selected countries between 2010 and 2016.

In Haiti, a total of 34,656 suspected cholera cases, including 339 related deaths (case fatality rate: 1\%), were reported from EW 1 to EW 43 of 2016.\(^2\)

On October 4 (EW 40), Hurricane Matthew landed in the commune of Les Anglais, Sud Department. The hurricane has seriously affected the departments of Sud and Grand’Anse, optimizing environmental and social conditions to facilitate the transmission of cholera. The intensified cholera surveillance established after Hurricane Matthew further demonstrates the impact of the event on Haiti. There has been an increase in the number of suspected cholera cases and the daily case numbers, which have increased to two or more times the numbers observed prior to the hurricane (Figure 1). From EW 40 to EW 45, the departments of Grand Anse and Sud contributed 23% and 26% respectively of the total cholera cases reported nationwide. These Departments correspond to 4% and 7% of the total population of Haiti, respectively.

Figure 1. Number of suspected cholera cases per day. Haiti. 1 September - 15 November 2016.

\(^1\) Isolated cholera case, Vibrio cholerae serogroup 01, serotype Ogawa, biotype El Tor no toxigenic

\(^2\) Preliminary data subject to change as new information is received.
Information on the cholera situation and the impact of Hurricane Matthew is updated periodically by the Haiti MSPP and is available at: http://mspp.gouv.ht/newsite/documentation.php?page=1&param1=valu1&param2=value2.

Detailed information on the support the Pan American Health Organization / World Health Organization (PAHO/WHO) is providing in response to Hurricane Matthew in Haiti is available at: http://www.paho.org/hq/index.php?option=com_content&view=article&id=12574&Itemid=42136&lang=es

In the Dominican Republic, a total of 1,097 suspected cholera cases, including 20 related deaths (case fatality rate: 1.8%), were reported from EW 1 to EW 42 of 2016. As shown in Table 1, this is almost twice the number of cases reported in the previous two years.

On 23 September 2016, Mexico3 reported a confirmed case of cholera in the state of Nayarit. The case was laboratory confirmed as *Vibrio cholerae* toxigenic serogroup O:1, serotype Ogawa. No additional cases have been reported.

### Advice to national authorities

Given the cholera situation on the island of Hispaniola, the PAHO / WHO recommends that Member States strengthen active surveillance systems for early detection of suspected cases and conduct rapid diagnostic laboratory confirmation of cases, in order to provide adequate treatment and prevent the spread of cholera. PAHO/WHO encourages Member States to continue with their efforts to ensure and maintain adequate sanitation and access to safe drinking water, in order to reduce the impact of cholera and other waterborne diseases.
