

Molecular surveillance to monitor
drug and diagnostic resistance in
Plasmodium falciparum in South and
Central America

Kumar V. Udhayakumar
Malaria Branch
DPDM, CGH, CDC

Monitoring Resistance in South America

- Drug resistant parasites are evolving independently in SA
- ACT has been in use since 2001
- Molecular surveillance is valuable and complementary to other tools

Molecular markers for drug resistance

❑ Chloroquine (CQ):

Pfcrt: Mutations at codons C72**S**, V73V, M74**I**, N75**E**, K76**T**

Pfmdr1: N86**Y**, Y184**F**, S1034**C**, N1042**D**, D1246**Y**

❑ Sulfadoxine + pyrimethamine (SP):

Pfdhps: S436**A/F/Y**, A437**G**, K540**E**, A581**G**, A613**S/T**

Pfdhfr : A16**V**, C50**R**, N51**I**, C59**R**, S108**N**, I164**L**

❑ Mefloquine (MQ), lumefantrine (LUM):

Pfmdr1: **Increase in gene copy number**

Pfmdr1: N86**Y**, Y184**F**, D1246**Y**

❑ Artemisinin:

*PfATPase6***???????**- Extensive efforts underway.....

Chloroquine resistance is fixed

CVMET/CVMNT-B

SVMNT-A

CVMNT -A/B

Two haplotypes
SVMNT/CVMNT-A
CVMNT/CVMET-B

SP resistance is fixed in most of the Amazon except in Peru and the coast

dhfr
50R, 51I, 108N
51I, 108N, 164L

dhps
437G, 540E, 581G

Low /no resistance
In the coast
Dhfr-single/WT
Dhps-Single/WT

SP is used with ART
for treatment

Pfmdr1

(N86Y, Y184F, S1034C, N1042D, D1246Y)

Quadruple/triple
mutants-fixed

Two haplotypes
(alpha and beta)

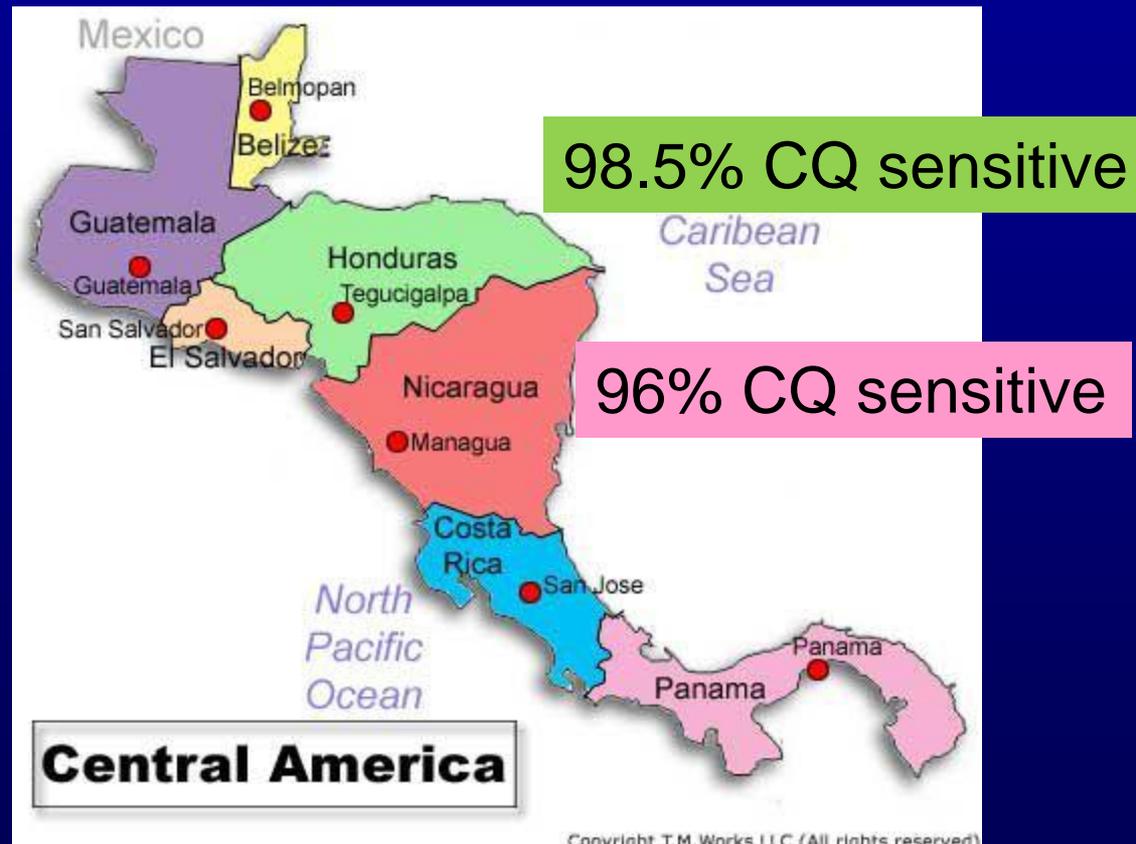

Copy number
increase in Venezuela
Suriname?
Not in Peru

MQ resisatnce?

mdr1
 β -lineage

mdr1
 α -lineage

Molecular surveillance for chloroquine resistance in Central America

Haiti- CQ and SP resistance genotypes 2010 samples

(preliminary analysis, Barnwell J et al unpublished)

<u>Molecular marker</u>	<u># samples</u>
CQ resistance	
WT (CVMNK)	105 (98.13%)
CVIET	2 (1.87%)
SP resistance	
<i>dhfr</i> WT	42(60.86%)
108N mutant	27(39.13%)
High resist. triple mutant	0 (0%)

(Total 345 blood spots, 118 +ve for 18S gene amplification)

Future Directions

A comprehensive molecular surveillance strategy is needed for the region (including for speciation)

Systematic surveillance –strategy may vary from region to region

Link all in vivo clinical trials with molecular marker analysis

Imported cases of malaria (travel history)

Malaria Research & Development Laboratory Unit
Malaria Branch, DPDM, CGH
Centers for Disease Control and Prevention

Background - Rapid Diagnostic Tests (RDTs) and malaria diagnosis

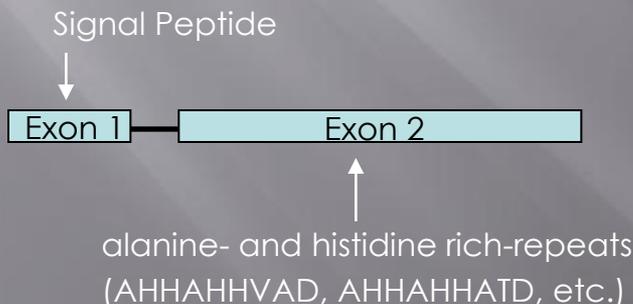

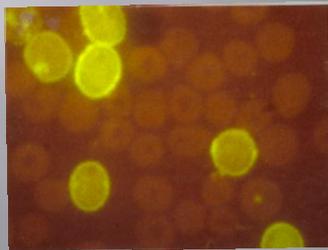

➤ Over the past two decades RDTs have become well accepted for malaria diagnosis in places where light microscopy is not available.

➤ RDTs are antigen-capture based assays detecting in whole blood:

1. *P. falciparum* histidine-rich protein-2 (HRP-2)
2. *Plasmodium* lactate dehydrogenase (pLDH)
3. *Plasmodium* aldolase enzyme

➤ HRP-2 is a stable soluble exported protein composed of largely histidine, alanine and aspartic acid amino acids arranged in a variety of tandem repeats.

Deletion of *hrp-2* and *hrp-3* genes in *P. falciparum* populations in the Peruvian Amazon

OPEN ACCESS Freely available online

A Large Proportion of *P. falciparum* Isolates in the Amazon Region of Peru Lack *pfhrp2* and *pfhrp3*: Implications for Malaria Rapid Diagnostic Tests

Current and Retrospective Survey of hrp2/hrp3 deletions in the Amazon Basin

▣ Purpose:

- Determine the current extent of *P. falciparum* populations with deletions of the Histidine-rich protein 2 (HRP2) and Histidine-rich protein 3 (HRP3) genes in the Amazon Basin and adjoining areas of South America.
- Retrospectively determine the origin and population history of the HRP2 and HRP3 deletions in South America through archived samples.

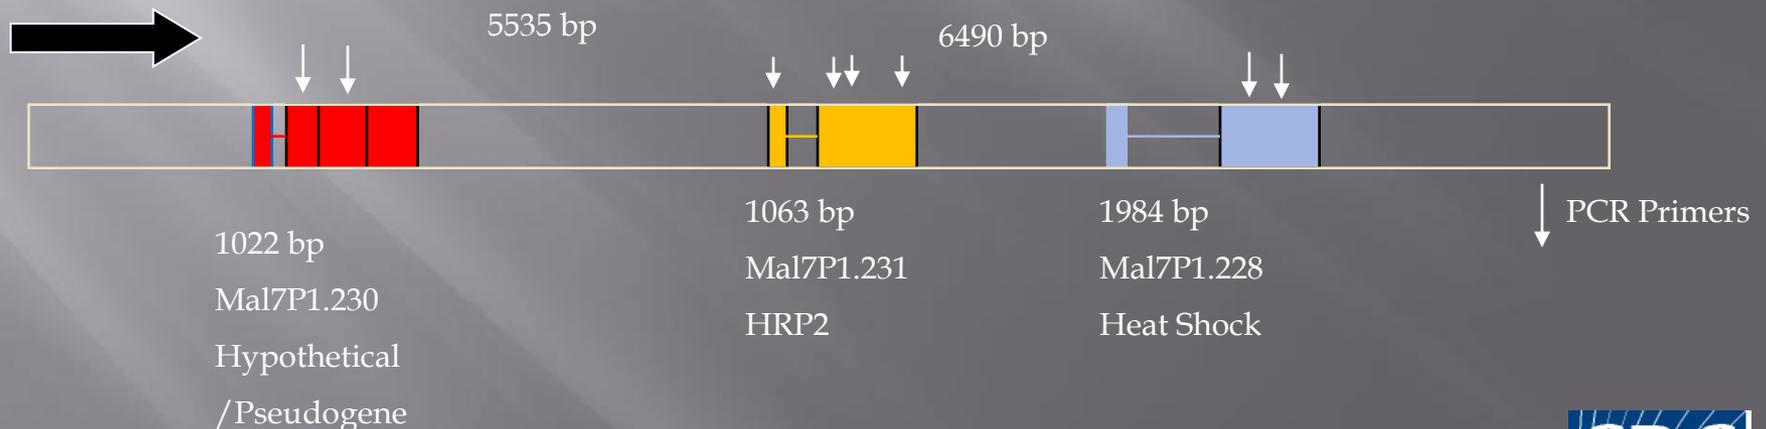

Basic Protocol

- ▣ Febrile patient, >5 yr., Microscopic diagnosis or pLDH RDT
- ▣ Single Pf infection, inform & consent
- ▣ 3 ml venous blood draw or FTA filter paper, information form, thick & thin film
- ▣ 3 aliquots of plasma and cellseach
- ▣ Molecularly analyse cell samples:
 - ▣ 1. test for species-specific rRNA
 - ▣ 2. Pf HRP2/3 and
 - ▣ 3. flanking genes
- ▣ Quantitatively assay plasma for HRP2

Genes of Interest in *hrp2* Locus

▣ HRP2:

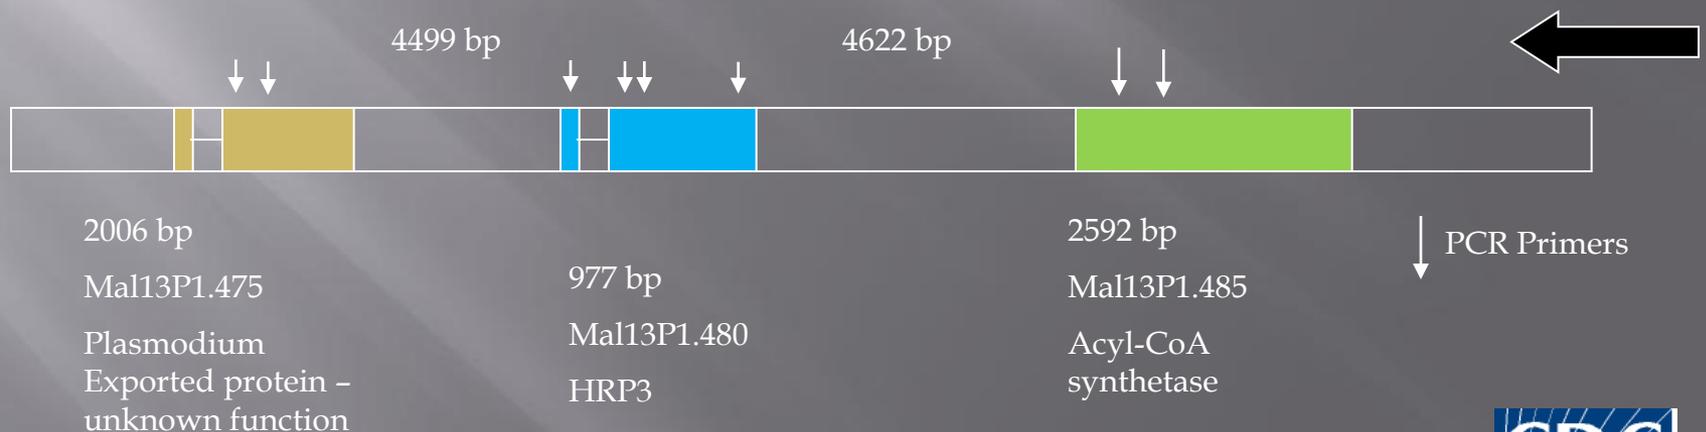

- Located on chromosome 7 (same chromosome as *Pfcr*t gene)
- Contains numerous histidine repeats (key trait exploited by RDTs for detection)
- Mal7P1_230 and Mal7P1_228 are the immediate upstream and downstream genes respectively.

Genes of Interest in *hrp3* Locus

▣ HRP3:

- Located on chromosome 13 near the telomeric region.
- Also contains numerous histidine repeats.
- Mal13P1_485 and Mal13P1_475 are the immediate upstream and downstream genes respectively.

 Retrospective

Training Activities

- ▣ Gustavo A. Fontecha-Sandoval, Universidad Nac. Autonoma de (Honduras) and Meisy E. Mendoza-Montoya, Laboratorio de Malaria, Tegucigalpa, Honduras (Jan 22-Feb 23, 2011)
- ▣ Lucia Ortiz-Batsche and Maria E. Castellanos-Reynosa, Univasidad de Valle of Guatemala, Guatemala (March 21 to April 17, 2010)

Training Activities (Cont.)

- ▣ Claribel Murillo-Solano, International Center for Medical Research CIDEIM, Cali, Columbia (Feb 14, 2010 to March 27, 2010)
- ▣ Molecular Training Workshop for the detection of HRP2/3 genetic deletions, Instituto Evandro Chagas, Belem, Brazil (Aug 30th-Sep 10th, 2010)
Trainees from 5 sites in Brazil, Guyana, Suriname
- ▣ On site training in Bolivia and Guyana (Kumar and Alex Macedo)- March 2010
