

Microclinic International

- **Mission:** transform how major non-communicable and infectious chronic conditions are prevented and managed worldwide by leveraging social networks
- A “Microclinic” is not a small building, but a **human network** consisting of small groups of people who share access to education, and social support as members work together to prevent and manage a deadly disease.
- MSNP has been evaluated with RCTs & other methodologies. Results have been published in ***The Lancet Global Health, Diabetes, Circulation***, etc.
- UN, MoHs, and U.S. Dept. of Public Health use MSNP
- MCI has been supported by the CDC, Google, Harvard, UCSF, UC Berkeley, World Diabetes Foundation, International Diabetes Foundation and many others

Making good health contagious

PAHO & MCI Partnership

Integrating the PAHO Chronic Care Passport & the Microclinic Social Network Program

- PAHO's Chronic Care Passport (CCP) is a useful tool for effective chronic care.
- The Microclinic Social Network Program (MSNP) has proven effective for improving clinical indicators, promoting and sustaining healthy behavior change, and bringing about improved health outcomes at scale.
- Integrating the CCP & MSNP holds great promise for further improving clinical and community care outcomes for non-communicable disease.

Expected Outcomes

- From a health systems perspective, the MSNP is a **pragmatic** way to scale NCD interventions & reduce NCD-related morbidity/mortality.
- MSNP **refocuses provision of health care on social units** - microclinic groups.
- Promotes sustainable **lifestyle changes** - healthier eating, more exercise, reductions in major complications, sustained long-term.
- Strengthens **linkages between primary care & health education**. Bridges the **continuum of care** to include building community capacity to prevent and manage NCDs.
- **Cost-savings for the health system:** scale + sustainability = sustainable lifestyle change to prevent and manage NCDs in the long-term.

Health is Contagious

Focus on the social aspects of chronic disease in addition to biological and environmental

social networks
+
healthy behavior
= positive health outcomes

1-2 countries will be selected to pilot CCP/MSNP integration

Final decision will be made July 29th
