FIRST AUTOCHTHONOUS VECTOR-BORNE CASES

In epidemiological week (EW) 4 of 2016, the United States of America International Health Regulations (IHR) National Focal Point (NFP) notified PAHO/WHO of the detection of the first confirmed case of autochthonous vector-borne transmission of Zika from Saint Croix, one of the three main islands of the U.S. Virgin Islands.

GEOGRAPHIC DISTRIBUTION

As of EW 34 of 2017, all three main islands of the U.S. Virgin Islands have reported suspected and confirmed Zika cases. Saint Thomas reported the highest number of cases (1,274 suspected including 683 confirmed cases) followed by Saint Croix (763 suspected including 252 confirmed) and Saint John (149 suspected including 89 confirmed).¹

TREND
As of EW 34 of 2017, a total of 2,182 suspected Zika cases, including 1,024 laboratory-confirmed cases, have been reported in the U.S. Virgin Islands. Between EW 28 and EW 39 of 2016, an increase in suspected cases was reported on the main islands, with Saint Thomas registering the highest increase. Since then, a downward trend in the number of cases has been observed in Saint Thomas (Figure 1). Saint Croix and Saint John reported a downward trend starting EW 47 and EW 45 of 2016 respectively. Transmission during 2017 continues with low intensity.

CIRCULATION OF OTHER ARBOVIRUSES
As of EW 33 of 2017, one laboratory-confirmed case of dengue (incidence rate of 1 case per 100,000 population) has been reported. In 2016, 48 laboratory-confirmed dengue cases (46 cases per 100,000) were reported in the U.S. Virgin Islands up to EW 52. In 2015, 103 laboratory-confirmed cases (99 cases per 100,000) were identified up to EW 40. In 2014, 10 laboratory-confirmed cases (10 cases per 100,000) were reported up to EW 53.

In regard to chikungunya, in 2015, 94 suspected and 24 confirmed cases (115 case per 100,000 population) were reported up to EW 49. In 2014, 1,321 suspected and 380 confirmed cases (1,620 cases per 100,000 population) were registered up to EW 53. No chikungunya data is available for 2016 and 2017.

ZIKA VIRUS DISEASE IN PREGNANT WOMEN
As of EW 34 of 2017, a total of 2,230 pregnant women have been tested for Zika virus in the U.S. Virgin Islands. Of these, 286 have been laboratory-confirmed for Zika virus infection.

ZIKA COMPLICATIONS
ZIKA-VIRUS-ASSOCIATED GUILLAIN-BARRÉ SYNDROME (GBS)
As of EW 35 of 2017, no cases of Zika-virus-associated Guillain-Barré syndrome (GBS) or other neurological syndromes have been reported by U.S. Virgin Islands health authorities to PAHO/WHO.

CONGENITAL SYNDROME ASSOCIATED WITH ZIKA VIRUS INFECTION
As of EW 35 of 2017, no cases of congenital syndromes associated with Zika virus infection have been reported by U.S. Virgin Islands health authorities to PAHO/WHO. According to a Morbidity and Mortality Weekly Report (MMWR) by the U.S. Centers for Disease Control and Prevention (CDC) published on 8 June 2017, about 5% of fetuses and infants born to women with laboratory evidence of recent possible Zika virus infection in the U.S. territories had possible Zika-associated birth defects, the same as the percentage reported in the 50 U.S. states during 2016.

DEATHS AMONG ZIKA CASES
As of EW 35 of 2017, no deaths among Zika cases have been reported by U.S. Virgin Islands health authorities to PAHO/WHO.
