Country decision

IS4H implementation

The PAHO/WHO Information Systems for Health initiative (IS4H) is a framework designed to support countries in improving their national information systems for health. It involves a series of steps, starting with learning and sharing, followed by maturity level assessment, roadmap implementation, data collection and management, reporting, health analysis and forecasting, informed policies and decisions, and finally learning and sharing again. The goal is to achieve interoperable health-related systems implemented, ensuring that countries can make informed decisions supported by accurate and timely health information.
