

Regional Weekly Trend of Suspected Measles and Rubella Cases, 2025 vs 2026 (EW 1-26)*

Total suspected MR cases summed across all included countries reporting suspected cases to PAHO

73,633

Cumulative total, EW1–26

11,395

Cumulative total in 2025

Reading the trend

- 2026 case counts have run far above 2025 in every week of the period, driven in large part by Guatemala's recalculated totals.
- 2026 shows a broad, sustained rise peaking around EW 6 and 16, in contrast to a lower, more gradual 2025 peak around EW17.
- Both years show a step-down in later weeks, which could be explained by underreporting.

Source: Immunization Data Warehouse. The epi curve excludes 1,810 cases that did not have onset of rash.

* Data as of 10 July 2026.
